The first part of your code that could have been done better is when creating a channel on the server part of the code, we noticed that the column on the right side does not display the clients that joined the channel correctly. It shows people that joined the channel after but does not display the one created for example if three clients join the channel, the first one that joined will be able to see client two and three, and the second one only client three, and client three will not be able to see anyone connected. Although sending messages and pm clients works fine it is just the display that was missed.

Further more, you can never do enough testing, all the error handling is implemented, but we never got around to testing everything. We believe we needed more testing on some extreme cases, to make the server robust

Regarding our bot, we had some problems with the !slap command. The command could have been more efficient and cleaner.

Overall, most of the requirements were implemented, what we lacked was bug testing and testing in general.
